HARBOR HARNESS / SKILLSBENCH TASK-PROVIDED VERIFIERS

60 tasks.
34% lower median cost.

Evaluated with the **Harbor harness and SkillsBench task-provided verifiers**, using paired native Claude Code and PennyRouter runs. PennyRouter reduced model-call cost, with no statistically significant difference in task rewards.

34.0%

LOWER MEDIAN MODEL-CALL COST PER TASK

95% interval for median change
−37.2% to −28.4%

Primary endpoint / 57 paired tasks
Wilcoxon $p = 4.13 \times 10^{-10}$

53 / 57	30.1%	57 pairs
Tasks with lower model-call cost	Reduction in summed model-call cost	Of 60 attempted tasks

Model-call cost, summed

$2.013 less across the included pairs. Notional USD from token usage and pinned rates, not a subscription bill.

Quality at a glance

Penny scored higher on 6 tasks, lower on 4, and tied on 47. Mean official reward was 0.621 through Penny versus 0.570 natively.

All 11 audit checks were accepted for the analyzed evidence. Task-level rewards, methodology and scope are documented on the following pages.

Where the difference appears.

Lower cache-token volumes accompany the cost reduction. Output volume is essentially unchanged in aggregate.

ENDPOINT	MEDIAN CHANGE	95% CI, MEDIAN %	SUM CHANGE	P-VALUE
Model-call cost	−34.0%	[−37.2, −28.4]	−30.1%	4.13e−10
Total tokens	−18.0%	[−21.1, −14.7]	−18.6%	4.82e−05
Output tokens	+4.3%	[−7.5, +7.3]	−0.7%	0.877
Fresh input tokens	+25.0%	[+14.3, +33.3]	+24.1%	3.72e−05
Cache-read tokens	−17.7%	[−23.0, −14.4]	−19.0%	1.18e−04
Cache-write tokens	−20.6%	[−28.1, −13.2]	−19.0%	3.76e−07
Model calls	+0.0%	[+0.0, +0.0]	+1.0%	0.912
Agent execution time	−13.4%	[−19.8, +9.3]	−20.2%	0.244

9.47M → 7.71M

Total captured tokens, native to Penny. Cache-read tokens account for most of the volume: 8.32M → 6.74M.

206,820 → 205,369

Output tokens, native to Penny. A 0.7% decrease in the sum is different from the +4.3% median task-level change.

How to read the statistics

Change = Penny / native - 1. Negative means less of the measured resource. The median treats each task equally; the sum is weighted by resource use. Intervals are the report's 95% intervals for the median. Cost is the primary endpoint; other endpoints are secondary and p-values are unadjusted.

p-values use the paired Wilcoxon signed-rank test on per-task log ratios. The cost Hodges-Lehmann estimate is -32.5%. Fresh input totals are small (788 vs. 978 tokens); the +25.0% median should not be confused with total input growth.

Agent execution time comes from Harbor's agent-execution span, not end-to-end benchmark duration. It excludes container build and agent installation, but includes work performed during agent execution. Lines written, an exploratory endpoint, had a 0.0% median change among 46 nonzero comparable pairs.

Methodology, quality & audit.

Harbor execution. SkillsBench verification.

Harbor runs the tasks in isolated containers; SkillsBench supplies the tasks and their verifiers. This report uses the official task rewards, including partial credit where the task awards it, without regrading. PennyBench pairs native and PennyRouter trials with pinned model and harness versions, records model requests, responses and token usage, and audits the retained evidence. Task rewards and execution artifacts make the reported results inspectable.

OFFICIAL TASK REWARDS / 57 PAIRS

0.570	0.621
Native mean reward	Penny mean reward

6	47	4
Penny higher	Equal reward	Penny lower

Sign test p = 0.754. No significant reward difference detected; this does not establish equal quality or non-inferiority. No non-inferiority margin was declared.

EVALUATION SCOPE

$60 = 57 + 2 + 1$

57 paired comparisons, 2 environment omissions, 1 incomplete pair.

Environment omissions: fix-visual-stability and drone-planning-control lack package inventories in both arms. They are excluded from audited evidence, with original rewards preserved in the appendix.

Incomplete pair: paratransit-routing timed out in the native arm. The pair is dropped from statistics. All omissions and the stopping point are post-hoc.

11 / 11 audit checks accepted

The 60-task report passes its evidence checks. This is not certification of task correctness or recovery of missing artifacts. Skill-name presence is not proof of Skill-tool invocation.

Completeness PASS Partial run accepted: 116 of 120 trials finished in audited evidence.	**Wire capture** PASS Decodable model calls for every completed included trial.	**Routing** PASS Captured calls match their declared arm host.
Version pins PASS Harness version and model match arm specifications.	**Adoption marker** N/A* Not checked: no adoption marker was declared.	**Skill availability** PASS Installed skill names appear in requests; invocation is not verified.
Cache isolation PASS Each trial has its own reference line in requests.	**Account plan** PASS Paired arms use the same recorded Pro account plan.	**Environment** PASS Included completed trials have matching paired package inventories.
Host isolation PASS No host home-directory path appears in requests.	**Pairing** PASS Finished pairs have both arms; excluded tasks did not run in this manifest.	**Interpretation** 60 TASKS *Adoption is a no-op check, accepted by the auditor without testing a marker.

Setup: SkillsBench v1.1 / Sonnet 5.5, medium / Claude Code 2.1.302 / task skills installed / one trial per arm / Pro plan / rates pinned 2026-10-15. Original selection: 72 tasks after 15 reference-solution exclusions from 87; this report covers the first 60 scheduled tasks. The evaluation was stopped by request; the stopping point and environment omissions were selected post-hoc, not pre-registered. This report does not claim completion of the original 72-task plan.

Every task. Every recorded reward.

Scheduled tasks 01-20 of 60. Official rewards, rounded to 3 decimals; no regrading. Reward scales and partial-credit rules are task-specific. Cost change uses model-call cost only.
